EDUCATION

Carnegie Mellon University, Pittsburgh, PA

Expected Graduation: Dec. 2027

Master of Information Systems Management in Business Intelligence and Data Analytics

Coursework: A/B Testing & Design Analysis, Applied Econometrics I, Organizational Design & Implementation, Statistics

New York University, Brooklyn, NY

Sep. 2022 - May 2026

Bachelor of Science in Computer Science; Minor: Mathematics, Game Engineering; Study Away @ NYU Shanghai, VinUniversity

Activities: CSE Leadership Award, CSE Peer Mentor, Theta Tau (Webmaster), Chinese Mei Society (VP), SHPE, HackNYU

TECHNICAL SKILLS

Analytics: SQL, Pandas, statistical analysis, A/B testing, applied econometrics, Excel, QuickSight, data visualization

Data & Cloud: AWS Athena, Lambda, S3, CloudWatch, DynamoDB, PostgreSQL, FastAPI, Docker

Programming: Python, Java, C/C++, JavaScript, TypeScript, MATLAB

Product & Delivery: Cross-functional requirements gathering, dashboard development, stakeholder reporting, Git, CI/CD

PROFESSIONAL EXPERIENCE

Amazon Inc. (Whole Foods Market), Austin, TX

Systems Development Engineer Intern

May 2025 – Aug. 2025

- Analyzed historical operational datasets using Python, SQL, and AWS Athena, developing forecasting and anomaly-detection pipelines that identified performance patterns and reduced stakeholder investigation cycles by 25%
- Built scalable data-processing frameworks with AWS Lambda, S3, CDK, and CloudWatch, improving data reliability by 15%, reducing latency by 10%, and lowering storage requirements by 45%
- Translated evolving stakeholder questions into QuickSight dashboards and decision-ready business insights, reducing manual reporting by 40% and enabling teams to evaluate operational trends through self-service analytics

NYU FAS (Computer and Information Technology), New York, NY

Student IT Support Technician

Jan. 2024 – Dec. 2025

- Managed IT assets by configuring 15+ macOS/Windows devices weekly, ensuring reliable performance and timely hardware replacements by installing software, resolving technical tickets, and streamlining asset tracking for long-term planning

PROJECTS

Conscious: Better Spending App | *Co-Founder & Developer*

May 2026 - Present

- Designed, built, and launched a production iOS budgeting application on the Apple App Store, independently owning architecture, data modeling, testing, deployment, and product iteration
- Architected a SwiftData system supporting transactions, budgets, recurring expenses, and categories, and built interactive analytics workflows that transform user transaction data into category-level purchasing trends and actionable budget insights

Urban Mobility & Emissions Digital Twin in Hanoi, Vietnam | *Simulation & Policy Analyst*

Jan. 2026

- Demonstrated that combining motorbike restrictions with 90% metro capacity lowered simulated pollution from 75k–85k to 16k–25k and reduced hotspots from approximately 12 to 4 by comparing five GAMA-based mobility scenarios
- Supported a recommendation to pair motorbike restrictions with transit expansion by translating traffic, vehicle-composition, and pollution results into policy tradeoffs and actionable next steps, contributing to the team's Best Presentation award

Hustle Hub Job Board | *Project Manager & Software Engineer*

Jan. 2025 – Dec. 2025

- Led development of a two-sided employment marketplace connecting applicants with employers and financial resources, gathering requirements from nontechnical stakeholders and translating user needs into product and analytics workflows
- Designed and delivered the platform using Angular, Django, PostgreSQL, and FastAPI, coordinating end-to-end execution across user research, interface design, backend development, documentation, and testing

Computer Simulation Projects | *Wildfire, Urban Animal Population, Urban Travel*

Jan. 2025 – May 2025

- Built MATLAB simulations for wildfire spread and predator–prey dynamics using probabilistic and differential-equation models, showing 30% faster burn rates with wind-aligned fronts and stable seasonal cycles in rat–cat–hawk populations
- Evaluated urban travel efficiency using path-finding algorithms and route-optimization simulations (100–1000 runs), showing that radial layouts achieved roughly 10% shorter effective travel distances than grid-based cities
